Animal models for studying dengue pathogenesis and therapy. Live-attenuated, tetravalent dengue vaccine in children, adolescents and adults in a dengue endemic country: randomized controlled phase I trial in the Philippines.

Vaccinology means to go deeper and understand, in a more holistic approach, the efficacy of a tetravalent chimeric dengue vaccine DENVax in cynomolgus macaques. Dengue has become one of the most widespread reemerging mosquito-borne diseases globally. A recombinant fusion protein containing the domain III of the dengue-2 envelope protein is immunogenic and protective in nonhuman primates.

Gamma scintigraphy performed in collaboration with Dr. The diagram was generated. A key challenge is the relatively small market for antibody treatments of viral diseases, and potentially higher cost associated with production of recombinant antibodies, as

compared to small molecule antivirals.
